
These charts were created by the Northeast Fisheries Observer Program to illustrate the spatial distribution of all observed individual incidental takes by species per month. The charts were developed using observer reported data in the OBSCON database. OBSCON data tend to be preliminary in nature and may be subject to change once the observer is debriefed and data are audited for accuracy. All charts were created using the Mercator world projection and the WGS 1984 datum.

All Observed Incidental Takes During February 2005
